The basic reason for the influence of the nature of an-
ions of electrolytes on the magnitude of the distribution
coefficient on joint electrodeposition of Co and Ni is
the difference in chemical affinity of anions of the elec-
trolyte adsorbed on the surface of the cathode, to the
ions of Co and Ni. This is confirmed by experimental
data obtained by measurements of the potentials of

The possibility is shown of significantly increasing or
decreasing the magnitude of the distribution coefficient
for the process of joint deposition of Co and Ni by using
electrolytes differing in the nature of their anions or by
introducing additives containing other anions into the
starting electrolyte. A direct dependence is established
between the magnitude of the distribution coefficient and
